servicenow HEALTH CHECK

POWERED BY SDI 

Best Practice Analysis of your ServiceNow Instance

ServiceNow Health Check helps you understand and improve the health of your ServiceNow instance. Built on best practice definitions gathered from analyzing thousands of instances, we'll analyze your ServiceNow instance to provide data points across five key categories: security, upgradability, performance, manageability, and usability. Findings from a Health Check help you understand where you may have areas for improvement. These data-driven insights help you form recommendations to optimize your instance's configuration so you can realize maximum value from the platform and your applications.

Examples of Best Practice Checks

Security

- Are appropriate properties set?
- Is the high security plugin enabled?
- Are there the right access control rules?

Upgradability

- What baseline functions have been changed?
- Are deprecated APIs used?
- What needs to be done before an upgrade?

Performance

- Are inefficient scripting techniques being used?
- Are report queries efficient?
- Do forms take too long to load?

Manageability

- How much code has been written?
- How many update sets are there?
- Is the CMDB populated appropriately?

User Experience

- Are the forms too big (with too many fields)?
- Are the processes efficient and well designed?
- Is the left navigation bar useful?

The Benefits of Performing a Health Check

Improve your understanding of instance health

Health Check helps you understand the health of your instance through the use of hundreds of best practice checks.

Identify how to optimize health & performance

Health Check data points and insights explain why your platform may not be performing optimally so you can take corrective action.

Help with accelerating upgrades

A Health Check performed during upgrade planning can proactively identify issues that help you perform upgrades in weeks, not months.

Uncover unnecessary customizations & configurations

Health Check helps you understand the health of your instance through the use of hundreds of best practice checks.

Health Check Scorecard

A ServiceNow Health Check supports hundreds of KPIs so you can evaluate your instance's health. The Health Check Scorecard, an interactive dashboard, presents key KPI metrics across the five health categories broken down by ServiceNow product. It identifies customizations and configurations and provides data points to guide you on improving your instance. Provided recommendations are arranged by importance to help prioritize improvement decisions.

ServiceNow Configuration Review

Expert advice is available to help you gain a deeper understanding of your Health Check findings. ServiceNow Configuration Review powered by Health Check is analysis performed by an expert ServiceNow consultant resulting in a report of deep insights into the level of technical debt in your instance. It provides a detailed list of all the specific findings found through both an automated scan and manual inspection. If applicable, this information contains the specific object and line number where the potential defect was found. The findings may result from reviews of coding best practices and indicators of process efficiency. The report also includes links to documentation and relevant areas of best practices.

Optimize Your ServiceNow License Utilization with SDI

SDI helps organizations maximize the value and utilization of their ServiceNow licenses through efficient management and optimization. We assist our customers in identifying unused or underutilized licenses, tracking software usage, and analyzing trends over time. By optimizing license allocations, we help reduce costs and ensure compliance with licensing agreements, delivering greater efficiency and value for their ServiceNow investment.

Additional ServiceNow Health Check Services

ServiceNow Health Check provides a range of capabilities to help align your instance to ServiceNow best practices. When you take advantage of a ServiceNow Customer Success package or use ServiceNow Expert Services for your implementation, the following capabilities may be available:

Automated Code Review with Health Check analyzes your development instance daily, providing fast feedback to your development team. This analysis helps ensure customizations using code following ServiceNow best practices.

ServiceNow Health Check Sprint Scan helps you implement ServiceNow more effectively. By linking with the ServiceNow implementation methodology, Now Create, it enables you to perform quality control check across your whole instance at the end of every implementation cycle. This check helps you avoid common implementation missteps and errors.

Upgrade Assessment with Health Check detects issues and barriers that may prevent your upgrade from being successful. By performing an evaluation against key best practices and pulling information from multiple other sources, a Health Check during upgrade planning helps you upgrade faster and with more confidence.
